

# Traditional Fabric Awnings

Keeping a home cool in summer can be difficult as windows offer very little resistance to heat flow.

When a house gets hot it is because heat is transmitted through the glass of an unprotected or poorly protected window.

The ultimate way of reducing heat flow through a window is to stop the heat from reaching it.

## System 2000

A strong and robust awning that consists of components made from technically superior materials and engineered to last in tough Australian conditions.

Ideal for ground floor windows, the awning rolls up into its own head box above the window when not in use.

Available in automatic or pivot arm styles with Tape & Rope and Gear & Crank operation.

## Automatic RUA

Ideal for verandas and balconies, it can be fixed from the ceiling to the floor between posts or from the ceiling to the top of the veranda rail.
